

THE FOUR PILLARS OF INTEGRATION: Salesforce Access Journey

How Identity, Conditional Access, ZTNA/SSE, and Telemetry create a unified access control plane

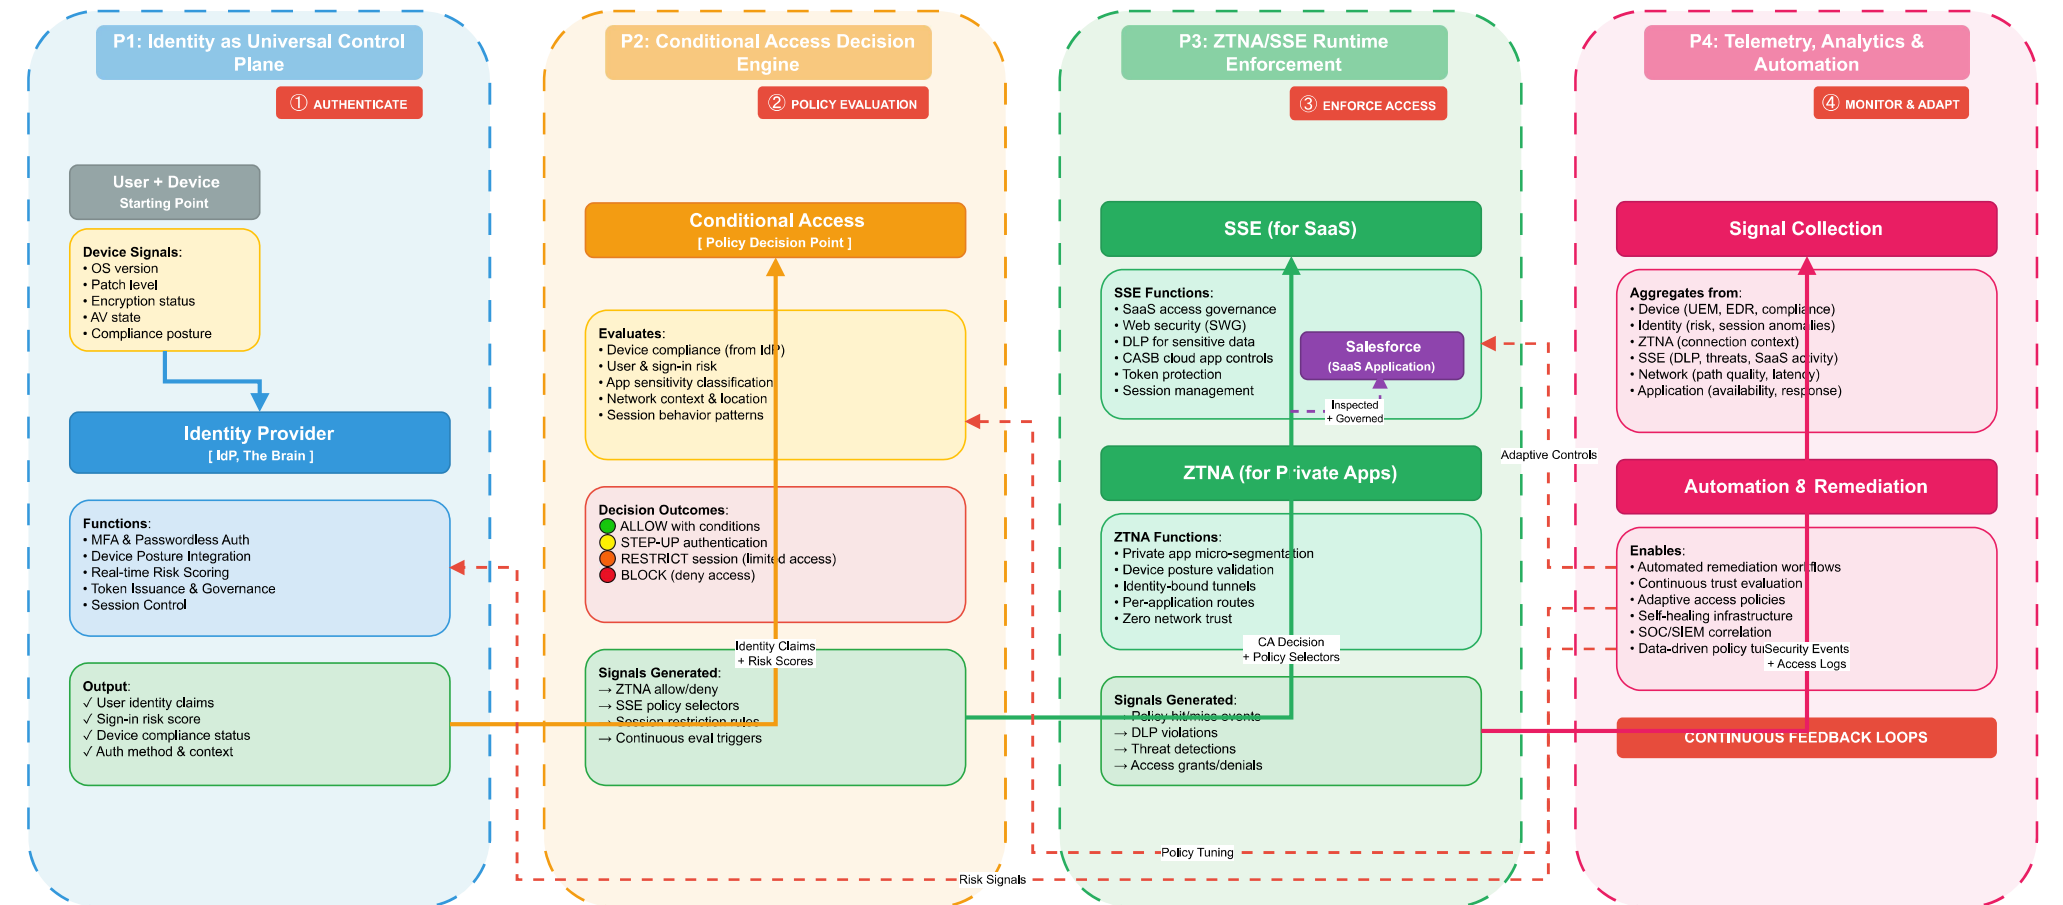

The Four Pillars - Identity, Conditional Access, ZTNA/SSE Enforcement, Telemetry & Automation

- **Signal Flow** - How device compliance influences identity decisions, which trigger network enforcement
 - **Decision Points** - Where policies are evaluated and enforced across the integration layer
 - **Continuous Feedback** - How telemetry feeds back to improve the entire system

Read left-to-right following the numbered flow, then observe the feedback loops returning signals to earlier pillars.

USE CASE: Opening Salesforce from Corporate Laptop

- ① Device compliance signals flow to Identity →
- ② Identity evaluates user + device →
- ③ Conditional Access decides ALLOW with conditions →
- ④ SSE enforces SaaS governance + DLP inspection →
- ⑤ Salesforce session established with token protection →
- ⑥ Telemetry monitors session behavior →
- ⑦ Anomaly detected triggers adaptive response →
- ⑧ Signals feedback to strengthen all pillars

Key Insight: Each pillar generates signals that feed the next pillar AND feedback to improve all previous pillars. This creates continuous evaluation, the foundation of Zero Trust.
