

# Enterprise Cloud As-Built Tool

Automated Landing-Zone Diagrams & Environment build reports

## Problem statement :

Establishing current-state is time consuming & is a frequent task across the Technology Cloud landscape ( precursor to an HLD, plus a major or minor operational change ).

## Why is a Cloud Audit tool required ?

- Accurate, reliable & a complete view of current-state architecture is difficult to achieve **manually**.
- Solution Architects need an audit automation tool to perform repeatable tasks.

### Current - Manual

12 Audits P/A takes 12 wks  
= **\$90k** (resource time)

### Proposed - Automated

12 Audits P/A takes 3 hrs  
= **\$ ~8.4k**

#### Benefits :

- Increased output,
- Optimisation
- Cost reduction

**Seeking endorsement to proceed\* with this initiative ?**

#### \* POC

1 YR self-hosted license : ~4.5k AUD,  
inc 10 sources

#### Prod Deployment

1 YR self-hosted license : ~8.4k AUD,  
inc 25 sources

# Cloud Specialist Tool are required to bridge Operational gaps

- 1

 **Solution :**  
Provide a live cloud app/platform topology / operational context

Challenges with existing tools :-

- a
- ServiceNow  
Asset Mgmt, CMDB

  - SNOW **CI/Service Mapping** is **not sufficient\*** to manage Cloud Applications.

- b
- Cloud App/Platform  
Documentation - Confluence

  - Current-State Cloud Diagrams – **Manual** & time consuming.

\* pto

- Solve both Cloud Ops challenges with a  
\*\* Specialist tool \*\*.**

## 3<sup>rd</sup> party cloud as-built tool

- Improve CloudOps Tasks
- Embed an iFrame (via API), directly into Snow & Confluence. i.e. live

Sample only

# ServiceNow

- ➔ IT Asset Management Centric  
(i.e. ITOM & ITSM)

## ✗ ITSM Service Map

## Service Map

- Asset centric configuration item (CI) view.
- Basic view of a *cloud application topology*.
- *Service Map* is not fit for purpose from a Cloud Operations Support perspective.

# Cloud Specialist Domain Tool

## 1 Solution :

- Embed solution design diagrams (iFrame) directly into CMDB.

## iFrame

# Cloud As-Built/Diagram Automation Tool - Benefits

| Cloud Ops – Task Improvement/Optimisation                      | Benefit                                                                                                                                   |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 1/ <b>Security Compliance [ IRAP/ISM ]</b>                     | Ongoing requirements exist to produce current-state diagrams/documentation.                                                               |
| 2/ <b>Delivery Phase (checkpointing)</b>                       | ‘Has the vendor delivered according to requirements ?’ or ‘Dev or UAT – Complete pre/post env state checks to support regression testing’ |
| 3/ <b>Application Readiness</b>                                | Pre-Handover of an Application or ad hoc troubleshooting requires current-state diagrams.                                                 |
| 4/ <b>Change Management</b>                                    | Version control & alerting feature will enhance this process.                                                                             |
| 5/ <b>Finops</b>                                               | During any phase of the development cycle, realise OpEx impact due to planned changes.                                                    |
| 6/ <b>Automatic or Controlled Design Documentation updates</b> | Cloud Application design updates will be automatically embedded into relevant Confluence page post a major change.                        |

# Hava.io | Proposed [REDACTED]

## Deployment Phase Summary

### Deployment phases

- 1/ DJCS may chose to begin with a POC, including 10 AWS sources.
- 2/ Scale up to 25 AWS sources.
- 3/ Negotiate custom pricing once AWS sources increase beyond 25.

Indicative pricing below assumes [REDACTED] selected self-hosted & no professional services.

**\* POC**

1 YR self-hosted license : ~4.5k AUD, inc. 10 sources

**Prod Deployment**

1 YR self-hosted license : ~8.4k AUD, inc. 25 sources

**Professional Services**  
Hava offers professional services packages via trusted partners

Hava Core self-hosted is paid in full with a minimum 12-month commitment, additional sources and data retention can be paid monthly via credit/debit card or quarterly, half-yearly and yearly by invoice (Bank Deposit Only). Prices shown are subject to applicable tax, and all prices are stated in USD.

## APPENDIX - Additional Subscription Options

### Additional Sources (Cloud Provider Accounts)

You only pay for Sources you need — which means predictable pricing you control and scales when you need.

| SOURCES          | BILLED AT |
|------------------|-----------|
| --Confidential-- |           |

\* given the bulk 500 license provided.

### Sources Explained

Sources are billed in minimum quantities of 10 at a blended rate based on the number of sources and the rate that applies — not an overall rate.

**Example:** If you have 60 sources, the first 10 will be at no additional charge. You'll be charged \$150/mo per 10 for the next 40 sources and then \$130/mo for the next 10 sources, bringing your total to \$730/mo.

| --Confidential-- |           |

# Hava Foundation Services

Whilst Hava provides clear and concise documentation for installation, configuration and integration, there are multiple ways that customers use the product and multiple ways that various custom views and diagram authorship occurs. Either Via Hava or a trusted third party, Hava can provide an installation and configuration so that you can take immensely high value on day 1 of using your service.

Services for your team includes:

- 1. Onboarding your team (invite, permissions, and projects)
- 2. How your data lives in Hava
- 3. Managing multiple teams
- 4. Custom search queries
- 5. Standard integrations (API/Confluence/GitActions)
